This document is a working review master for literature mapping, field understanding, and later Introduction drafting. Keep source-oriented notes here first, and move only checked points into the manuscript-ready notes at the end of each section.

1 Pumped-storage and upper reservoir operation

1.1 Question-oriented notes

Use this subsection to group notes by question so that later Introduction paragraphs can be drafted from themes rather than from individual papers.

1.2 Cross-paper synthesis

Record consensus, disagreement, and the remaining gap across multiple papers before deciding what belongs in the manuscript.

1.3 Paper notes

Use this subsection for source-by-source notes after checking the original paper directly.

1.4 Manuscript-ready notes

Distill only checked points that are worth carrying into the eventual Introduction.

2 Shallow basin / reservoir flow patterns

2.1 Question-oriented notes

Use this subsection to group notes by question so that later Introduction paragraphs can be drafted from themes rather than from individual papers.

2.2 Cross-paper synthesis

Record consensus, disagreement, and the remaining gap across multiple papers before deciding what belongs in the manuscript.

2.3 Paper notes

Use this subsection for source-by-source notes after checking the original paper directly.

2.4 Manuscript-ready notes

Distill only checked points that are worth carrying into the eventual Introduction.

3 Reversible inflow-outflow and mode asymmetry

3.1 Question-oriented notes

Use this subsection to group notes by question so that later Introduction paragraphs can be drafted from themes rather than from individual papers.

3.2 Cross-paper synthesis

Record consensus, disagreement, and the remaining gap across multiple papers before deciding what belongs in the manuscript.

3.3 Paper notes

Use this subsection for source-by-source notes after checking the original paper directly.

3.4 Manuscript-ready notes

Distill only checked points that are worth carrying into the eventual Introduction.

4 Surface PIV and physical modeling

4.1 Question-oriented notes

Use this subsection to group notes by question so that later Introduction paragraphs can be drafted from themes rather than from individual papers.

4.2 Cross-paper synthesis

Record consensus, disagreement, and the remaining gap across multiple papers before deciding what belongs in the manuscript.

4.3 Paper notes

Use this subsection for source-by-source notes after checking the original paper directly.

4.4 Manuscript-ready notes

Distill only checked points that are worth carrying into the eventual Introduction.

5 Scaling and similitude

5.1 Question-oriented notes

Use this subsection to group notes by question so that later Introduction paragraphs can be drafted from themes rather than from individual papers.

5.2 Cross-paper synthesis

Record consensus, disagreement, and the remaining gap across multiple papers before deciding what belongs in the manuscript.

5.3 Paper notes

Use this subsection for source-by-source notes after checking the original paper directly.

5.4 Manuscript-ready notes

Distill only checked points that are worth carrying into the eventual Introduction.

6 Sedimentation / CFD linkage

6.1 Question-oriented notes

Use this subsection to group notes by question so that later Introduction paragraphs can be drafted from themes rather than from individual papers.

6.2 Cross-paper synthesis

Record consensus, disagreement, and the remaining gap across multiple papers before deciding what belongs in the manuscript.

6.3 Paper notes

Use this subsection for source-by-source notes after checking the original paper directly.

6.4 Manuscript-ready notes

Distill only checked points that are worth carrying into the eventual Introduction.
